Content:

And it's not all about large scale either. Scale isn't always desirable; as Bill McKibben wrote in Eaarth, we'd probably be better off with the Fortune 500,000 than the Fortune 500. Scale brings with it the ills of Seeing Like a State; the authoritarian high modernist mindset takes over at large scale. And while large organizations can exist, they can't be the only ones with access to, or ability to, afford new technologies. Enabling the dynamic creation and destruction of new organizations and new types of organization—and legal and technical mechanisms to prevent lock-in and to prevent enclosure of public commons—will be essential to keep this new fluid era thriving. We can create new “federated” networks of organizations and social groups, like we're seeing in the open social web of Mastodon and similar technologies, ones where local groups can have local rules that differ from, but do not conflict with, their participation in the wider whole.

Annotation/description:

With the growing attention and investment in recent AI approaches such as large language models, the narrative that the larger the AI system the more valuable, powerful and interesting it is is increasingly seen as common sense. But what is this assumption based on, and how are we measuring value, power, and performance? And what are the collateral consequences of this race to ever-increasing scale? Here, we scrutinize the current scaling trends and trade-offs across multiple axes and refute two common assumptions underlying the 'bigger-is-better' AI paradigm: 1) that improved performance is a product of increased scale, and 2) that all interesting problems addressed by AI require large-scale models. Rather, we argue that this approach is not only fragile scientifically, but comes with undesirable consequences. First, it is not sustainable, as its compute demands increase faster than model performance, leading to unreasonable economic requirements and a disproportionate environmental footprint. Second, it implies focusing on certain problems at the expense of others, leaving aside important applications, e.g. health, education, or the climate. Finally, it exacerbates a concentration of power, which centralizes decision-making in the hands of a few actors while threatening to disempower others in the context of shaping both AI research and its applications throughout society.

Content:

Ostrom discovered that communities can and do avert the tragedy of the commons, especially when they embrace eight core design principles: 1) Clearly define the community managing the resource. 2) Ensure that the rules reasonably balance between using the resource and maintaining it. 3) Involve everyone who's affected by the rules in the process of writing the rules. 4) Establish mechanisms to monitor resource use and behavior. 5) Create an escalating series of sanctions for rule-breakers.

“INTRODUCING GABRIELLA GARCIA & ARNAB CHAKRAVARTY: PROJECT D33PTHR0AT 🐼 Our Slow AI soup is boilin and as usual, we love to show faces and ideas behind the scenes, so we asked. 🗣️ Who are Gabriella & Arnab? What did they propose to do within Small AI stream? 🗣️ Gabriella Garcia is a creative researcher with over a decade of experience of sharing stories about networked subcultures and technologically-enabled intimacy. She is currently developing a practice that uses speculative fiction and magical realism to gather sex workers together over designing futures toward potential real-world solutions. She has presented work at the NYU Institute for Public Knowledge, Parsons Cloud Salon, Harvard Berkman Klein Center for Internet & Society, Stony Brook University, UMass Amherst, and Brown University. She has collaborated with Hacking//Hustling, Surveillance Technology Oversight Project, Decriminalized Future’s Ladies of the Night School, and Museum of Sex. 🗣️ Currently honored as the recipient of the Creative Media Award from the Mozilla Foundation, Arnab is engaged in crafting a game that delves into the human toll of AI, delving into the profound notion that machines may forever remain distant from the nuanced essence of what we consider intrinsically human. Arnab’s artistic footprint extends to various notable venues, including the India Art Fair, FAB:Learn, No:Quarter, Bengaluru MakerFaire, Kochi Bienalle, and NYC Media Lab. Wait.. what is Slow AI? 🐼 A project that seeks to unpack and nourish alternative narratives for AI outside Silicon Valley ideologies. Inspired by counter movements like slow fashion and slow food, it aims to “imagine and craft the worlds we cannot live without, just as we dismantle the ones you cannot live within” - Ruha Benjamin. Slow AI is made possible through the support of @stimuleringsfonds Creative Industries. 🐼 #SlowAIXDESIGN #SlowAI”.

Comments (1):

- **tf** (2025-08-30): surprising that an American life is with an additional 12.6 NY-SF flights. Maybe I travel more than the average American but I feel like I've taken more than 12 flights like that. And I suppose the supplemental American CO2 isn't all be attributed to flights.

(Why bigger isn't better: towards small scale worlding)

Content:

They are not trying to make the Next Big Thing, but instead something small yet significant. I used to believe that I wanted to change The World. But actually, what I appreciate most about being an artist is the ability to change my world. Lowercase, local and miniature, a more immediate universe that I can reach out and touch.

Annotation/description:

The AI research community plays a vital role in shaping the scientific, engineering, and societal goals of AI research. In this position paper, we argue that focusing on the highly contested topic of artificial general intelligence' (AGI') undermines our ability to choose effective goals. We identify six key traps - obstacles to productive goal setting - that are aggravated by AGI discourse: Illusion of Consensus, Supercharging Bad Science, Presuming Value-Neutrality, Goal Lottery, Generality Debt, and Normalized Exclusion. To avoid these traps, we argue that the AI research community needs to (1) prioritize specificity in engineering and societal goals, (2) center pluralism about multiple worthwhile approaches to multiple valuable goals, and (3) foster innovation through greater inclusion of disciplines and communities. Therefore, the AI research community needs to stop treating `AGI` as the north-star goal of AI research.

Annotation/description:

Once Upon A Garden is a speculative archive of critically endangered and extinct flora that we have little to no records of, and therefore no way to remember. In this project, the artist Linda Dounia uses Artificial Intelligence as a time machine to go back in time and piece together data we didn't bother recording using data that we did record. To be able to fill gaps in the world's collective memory with synthetic memory is a unique opportunity that AI offers today. Between 2021 and now, Once Upon A Garden has speculated on what the flora population in West Africa (where Dounia is from and lives) might have looked like decades ago using increasingly faster and more refined models. The resulting body of work, while increasingly more photo-realistic as AI became more powerful over the years, cannot be mistaken for reality due to the thin and fragmented data available for training. Global efforts to record disappearing biodiversity have not been consistent across time and geographies. In

some places, when interrogating what's been lost, we have no photographic records and can only rely on herbarium records dating back to colonial expeditions. Once Upon A Garden ultimately makes a case for more even efforts in recording biodiversity loss across the globe. It also shows an alternative use of AI that demonstrates how this technology can hold a mirror to what we care to remember and therefore record. Incidentally, this mirror also shows us what gets left behind in the making of an increasingly more influential tool in our lives and societies. The Chapters There is no longer any doubt about the transformative potential of AI. Yet, its proliferation has also uncovered gaping holes in how and where data about humanity is collected, stored, and preserved. AI is only ever as good as the data it's trained on. Still, there seems to be a clear unevenness in how much information AI has about non-Western ideas, contexts, people, and environments. This is evident in how common stereotypes and hallucinations are when interrogating generative AI tools today, be it language or image based. Each chapter of Once Upon A Garden starts with the same foundational data: records of extinct and critically endangered flora from the Sahel region of West Africa, as classified by the International Union for Conservation of Nature. This means photographic records from the internet (seldom available), photographic records from physical archives (national archives, family photo books, journals, etc.), herbarium records, encyclopaedic records, and academic records. From these records, individual species are identified and tagged with all available information about it (texts and images). Chapter I, 2021-2022 For the first chapter of Once Upon A Garden, Dounia trained a GAN on real and imagined visual records of extinct and critically endangered flora from the Sahel region of West Africa. The 'real' visual records were all the available images gathered in the database for this project. The 'imagined' records were synthesised with a diffusion model using text records when 'real' images weren't available. Due to the fragmentary records of biodiversity in West Africa, this GAN thus featured more imagined records than real ones. Dounia knew that some distortion and lossiness was to be expected from the GAN's outputs, considering so much of its data was created by the imagination of another model. She believed though that this lossiness provided an apt metaphor for the ongoing disappearance of the natural world, and how thorough that disappearance was in places where we didn't care to remember what's left and what's been lost. From this first chapter, individual flower outputs were curated, animated, and composited into a variety of artificial gardens. These gardens were installed at various exhibitions and art fairs around the world, starting as a special project commissioned by ARTX LAGOS in 2022. Chapter II, 2022 Once Upon A Garden's second chapter begins with the species that emerged from the GAN, shortly after training was completed. In this chapter, Dounia attempted to further denoise images of the flowers with a text-to-image diffusion. Using the text data gathered at the onset of the project as prompt, she endeavoured to bring more life into the GAN outputs. The spectral suggestions of flowers from the first chapter turned into more recognizable and familiar objects. Dounia realised then that as AI models inevitably evolved, their ability to remember would only get stronger. It felt important to continue exploring how much more refined the synthetic memories of the flowers could be with each milestone in the evolution of models. The flowers from this chapter have never been previously released. Chapter III, 2022-2023 The third chapter of Once Upon A Garden deepens the narrative of loss and memory, featuring the most detailed synthetic flowers up to this point. In this chapter, Dounia compares different diffusion models using a similar approach to Chapter II, starting with text data from the initial database for the project, and using the GAN to Text-to-Image pipeline outputs as reference images. The release of Midjourney v.6 toward the end of 2023 provided the most detailed and faithful outputs to the initial data and was thus used for the release of Flore Perdue commissioned by Bright Moments for its Paris edition. This release also introduced a p5 algorithm that obscured the striking

details from the outputs, reminding the audience that no matter how much more detailed and may have seemed, the flowers were still speculative. Chapter IV, 2023-2024 Once Upon A Garden plays with entropy. Between the first and the third chapter, it is concerned with decreasing entropy by introducing more data that is digested by more powerful models to arrive at a system where flowers have familiar and distinct embodiments. Starting in the fourth chapter though, Dounia starts the process of rewilding this body of work and increasing entropy. First, lossiness is added to flowers from the fourth chapter by adding non-organic materials to their make-up. Second, gardens from the first chapter are re-explored through wilder and more chaotic floral arrangements. Through an Image-to-Image pipeline, flowers are corrupted. Then using a p5 collage algorithm, they are randomly picked and placed on a canvas to create gardens. These gardens have only been released as private commissions. Chapter V, 2024 The final chapter of Once Upon A Garden, titled Synthetic Rot, is the culmination of this body of work spanning four years. It traces generative AI models' evolution over this period and their ability to help us speculate on and synthesise the past. This chapter presents 50 stills and 50 videos of randomly assorted flowers, often with multiple different species sharing the same stem, behaving erratically, making and remaking themselves with only chaos as a compass. Each video is accompanied with the reference still image that was used as a keyframe to create the video. Flowers from the previous chapter are made even less organic through an Image-to-Image pipeline. The outputs are then used as keyframes to create animations using Runway's Gen 3 Alpha. The soundtrack for the videos is created by mixing three types of recorded sounds (nature, machinery, people at work) with desert blues musical tracks made in Suno AI. Synthetic Rot is the wildest stage of this body of work, where flowers are composed of mostly inorganic material, exposing the fact that they are primordially data mediated through our screens by code made possible by machinery built with natural resources.

Annotation/description:

The panopticon is a type of institutional building and a system of control designed by the English philosopher and social theorist Jeremy Bentham in the 18th century. The concept of the design is to allow all prisoners of an institution to be observed by a single security guard, without the inmates being able to tell whether they are being watched.

Although it is physically impossible for the single guard to observe all the inmates' cells at once, the fact that the inmates cannot know when they are being watched means that they are motivated to act as though they are being watched at all times. Thus, the inmates are effectively compelled to regulate their own behaviour. The architecture consists of a rotunda with an inspection house at its centre. From the centre, the manager or staff of the institution are able to watch the inmates. Bentham conceived the basic plan as being equally applicable to hospitals, schools, sanatoriums, and asylums, but he devoted most of his efforts to developing a design for a panopticon prison. It is his prison that is now most widely meant by the term "panopticon".

The word panopticon derives from the Greek word for "all seeing" - panoptes. In 1785, Jeremy Bentham, an English social reformer and founder of utilitarianism, travelled to Krichев in Mogilev Governorate of the Russian Empire (modern Belarus) to visit his brother, Samuel, who accompanied Prince Potemkin.:xxxviii Bentham arrived in Krichев in early 1786 and stayed for almost two years. While residing with his brother in Krichев, Bentham sketched out the concept of the panopticon in letters. Bentham applied his brother's ideas on the constant observation of workers to prisons. Back in England, Bentham, with the assistance of his brother, continued to develop his theory on the panopticon.:xxxviii Prior to fleshing out his ideas of a panopticon prison, Bentham had drafted a complete penal code and explored fundamental legal theory. While in his lifetime Bentham was a prolific letter writer, he published little and remained obscure to the public until his death.:385

Bentham thought that the chief mechanism that would bring the manager of the panopticon prison in line with the duty to be humane would be publicity. Bentham tried to put his duty and interest junction principle into practice by encouraging a public debate on prisons. Bentham's inspection principle applied not only to the inmates of the panopticon prison, but also the manager. The unaccountable gaoler was to be observed by the general public and public officials. The apparently constant surveillance of the prison inmates by the panopticon manager and the occasional observation of the manager by the general public was to solve the age old philosophic question: "Who guards the guards?"

Bentham continued to develop the panopticon concept, as industrialisation advanced in England and an increasing number of workers were required to work in ever larger factories. Bentham commissioned drawings from an architect, Willey Reveley. Bentham reasoned that if the prisoners of the panopticon prison could be seen but never knew when they were watched, the prisoners would need to follow the rules. Bentham also thought that Reveley's prison design could be used for factories, asylums, hospitals, and schools.

Bentham remained bitter throughout his later life about the rejection of the panopticon scheme, convinced that it had been thwarted by the king and an aristocratic elite. It was largely because of his sense of injustice and frustration that he developed his ideas of sinister

interest – that is, of the vested interests of the powerful conspiring against a wider public interest – which underpinned many of his broader arguments for reform.

The Building circular – an iron cage, glazed – a glass lantern about the size of Ranelagh – The Prisoners in their Cells, occupying the Circumference – The Officers, the Centre. By Blinds, and other contrivances, the Inspectors concealed from the observation of the Prisoners: hence the sentiment of a sort of invisible omnipresence. – The whole circuit reviewable with little, or, if necessary, without any, change of place.

— Jeremy Bentham (1791). Panopticon, or The Inspection House

Bentham's proposal for a panopticon prison met with great interest among British government officials not only because it incorporated the pleasure-pain principle developed by the materialist philosopher Thomas Hobbes, but also because Bentham joined the emerging discussion on political economy. Bentham argued that the confinement of the prison, "which is his punishment, preventing [the prisoner from] carrying the work to another market." [clarification needed – missing verb] Key to Bentham's proposals and efforts to build a panopticon prison in Millbank at his own expense, was the "means of extracting labour" out of prisoners in the panopticon. In his 1791 writing Panopticon, or The Inspection House, Bentham reasoned that those working fixed hours needed to be overseen. Also, in 1791, Jean Philippe Garraon de Coulon presented a paper on Bentham's panopticon prison concepts to the National Legislative Assembly in revolutionary France.

In 1812, persistent problems with Newgate Prison and other London prisons prompted the British government to fund the construction of a prison in Millbank at the taxpayers' expense. Based on Bentham's panopticon plans, the National Penitentiary opened in 1821. Millbank Prison, as it became known, was controversial, even blamed for causing mental illness among prisoners [citation needed]. Nevertheless, the British government placed an increasing emphasis on prisoners doing meaningful work, instead of engaging in humiliating and meaningless kill-times. Bentham lived to see Millbank Prison built and did not support the approach taken by the British government. His writings had virtually no immediate effect on the architecture of taxpayer-funded prisons that were to be built. Between 1818 and 1821, a small prison for women was built in Lancaster. It has been observed that the architect Joseph Gandy modelled it very closely on Bentham's panopticon prison plans. The K-wing near Lancaster Castle prison is a semi-rotunda with a central tower for the supervisor and five storeys with nine cells on each floor.

It was the Pentonville prison, which was built in London after Bentham's death in 1832, that was to serve as a model for a further 54 prisons in Victorian Britain. Built between 1840 and 1842 according to the plans of Joshua Jebb, Pentonville prison had a central hall with radial prison wings. It has been claimed that Bentham's panopticon influenced the radial design of 19th-century prisons built on the principles of the "separate system", including Eastern State Penitentiary in Philadelphia, which opened in 1829. But the Pennsylvania-Pentonville architectural model with its radial prison wings was not designed to facilitate constant surveillance of individual prisoners. Guards had to walk from the hall along the radial corridors and could only observe prisoners in their cells by looking through the cell door's peephole.

In 1925, Cuba's president Gerardo Machado set out to build a modern prison, based on Bentham's concepts and employing the latest scientific theories on rehabilitation. A Cuban envoy tasked with studying US prisons in advance of the construction of Presidio Modelo had been greatly impressed with Stateville Correctional Center in

Illinois and the cells in the new circular prison were too faced inwards towards a central guard tower. Because of the shuttered guard tower, the guards could see the prisoners, but the prisoners could not see the guards. Cuban officials theorised that the prisoners would “behave” if there was a probable chance that they were under surveillance, and once prisoners behaved, they could be rehabilitated.

Between 1926 and 1931, the Cuban government built four such panopticons connected with tunnels to a massive central structure that served as a community centre. Each panopticon had five floors with 93 cells. In keeping with Bentham’s ideas, none of the cells had doors. Prisoners were free to roam the prison and participate in workshops to learn a trade or become literate, with the hope being that they would become productive citizens. However, by the time Fidel Castro was imprisoned at Presidio Modelo, the four circulars were packed with 6,000 men, every floor was filled with trash, there was no running water, food rations were meagre, and the government supplied only the bare necessities of life.

In the Netherlands Breda, Arnhem and Haarlem penitentiary are cited as historic panopticon prisons. However, these circular prisons with their 400 or so cells fail as panopticons because the inwards-facing cell windows were so small that guards could not see the entire cell. The lack of surveillance that was actually possible in prisons with small cells and doors discounts many circular prison designs from being a panopticon as it had been envisaged by Bentham. In 2006, one of the first digital panopticon prisons opened near Amsterdam. Every prisoner in the Lelystad Prison wears an electronic tag and by design, only six guards are needed for 150 prisoners instead of the usual 15 or more. Jeremy Bentham’s panopticon architecture was not original, as rotundas had been used before, as for example in industrial buildings. However, Bentham turned the rotund architecture into a structure with a societal function, so that humans themselves became the object of control. The idea for a panopticon had been prompted by his brother Samuel Bentham’s work in Russia and had been inspired by existing architectural traditions. Samuel Bentham had studied at the Ecole Militaire in 1751, and at about 1773 the prominent French architect Claude-Nicolas Ledoux had finished his designs for the Royal Saltworks at Arc-et-Senans. William Strutt in cooperation with his friend Jeremy Bentham built a round mill in Belper, so that one supervisor could oversee an entire shop floor from the centre of the round mill. The mill was built between 1803 and 1813 and was used for production until the late 19th century. It was demolished in 1959. In Bentham’s 1812 writing *Pauper management improved*: particularly by means of an application of the Panopticon principle of construction, he included a building for an “industry-house establishment” that could hold 2000 persons. In 1812 Samuel Bentham, who had by then risen to brigadier-general, tried to persuade the British Admiralty to construct an arsenal panopticon in Kent. Before returning home to London he had constructed a panopticon in 1807, near St Petersburg, which served as a training centre for young men wishing to work in naval manufacturing. The panopticon, Bentham writes: will be found applicable, I think, without exception to all establishments whatsoever, in which within a space not too large to be covered or commanded by buildings, a number of persons are meant to be kept under inspections. No matter how different or even opposite the purpose.

— Jeremy Bentham (1791). *Panopticon, or The Inspection House*

Despite the fact that no panopticon was built during Bentham’s lifetime, the principles he established on the panopticon prompted considerable discussion and debate. Shortly after Jeremy Bentham’s death in 1832 his ideas were criticised by Augustus Pugin, who in 1841 published the second edition of his work *Contrasts* in which one plate showed a “Modern Poor House”. He contrasted an English medieval gothic town in 1400 with the same town in 1840 where

broken spires and factory chimneys dominate the skyline, with a panopticon in the foreground replacing the Christian hospice. Pugin, who went on to become one of the most influential 19th-century writers on architecture, was influenced by Hegel and German idealism. In 1835 the first annual report of the Poor Law Commission included two designs by the commission's architect Sampson Kempthorne. His Y-shape and cross-shape designs for workhouse expressed the panopticon principle by positioning the master's room as central point. The designs provided for the segregation of occupants and maximum visibility from the centre. Professor David Rothman came to the conclusion that Bentham's panopticon prison did not inform the architecture of early asylums in the United States.

Criticism and use as metaphor In 1965, the conservative historian Shirley Robin Letwin traced the Fabian zest for social planning to early utilitarian thinkers. She argued that Bentham's pet gadget, the panopticon prison, was a device of such monstrous efficiency that it left no room for humanity. She accused Bentham of forgetting the dangers of unrestrained power and argued that "in his ardour for reform, Bentham prepared the way for what he feared". Recent Libertarian thinkers began to regard Bentham's entire philosophy as having paved the way for totalitarian states. In the late 1960s, the American historian Gertrude Himmelfarb, who had published *The Haunted House of Jeremy Bentham* in 1965, was at the forefront of depicting Bentham's mechanism of surveillance as a tool of oppression and social control. David John Manning published *The Mind of Jeremy Bentham* in 1986, in which he reasoned that Bentham's fear of instability caused him to advocate ruthless social engineering and a society in which there could be no privacy or tolerance for the deviant.

In the mid-1970s, the panopticon was brought to the wider attention by the French psychoanalyst Jacques-Alain Miller and the French philosopher Michel Foucault. In 1975, Foucault used the panopticon as metaphor for the modern disciplinary society in *Discipline and Punish*. He argued that the disciplinary society had emerged in the 18th century and that discipline are techniques for assuring the ordering of human complexities, with the ultimate aim of docility and utility in the system. Foucault first came across the panopticon architecture when he studied the origins of clinical medicine and hospital architecture in the second half of the 18th century. He argued that discipline had replaced the pre-modern society of kings, and that the panopticon should not be understood as a building, but as a mechanism of power and a diagram of political technology.

Foucault argued that discipline had already crossed the technological threshold in the late 18th century, when the right to observe and accumulate knowledge had been extended from the prison to hospitals, schools, and later factories. In his historic analysis, Foucault reasoned that with the disappearance of public executions pain had been gradually eliminated as punishment in a society ruled by reason. The modern prison in the 1970s, with its corrective technology, was rooted in the changing legal powers of the state. While acceptance for corporal punishment diminished, the state gained the right to administer more subtle methods of punishment, such as to observe. The French sociologist Henri Lefebvre studied urban space and Foucault's interpretation of the panopticon prison, arriving at the conclusion that spatiality is a social phenomenon. Lefebvre contended that architecture is no more than the relationship between the panopticon, people, and objects. In urban studies, academics such as Marc Schuilenburg now argue that a different self-consciousness arises among humans who live in an urban area.

In 1984, Michael Radford gained international attention for the cinematographic panopticon he had staged in the film *Nineteen Eighty-Four*. Of the telescreens in the landmark surveillance narrative *Nineteen Eighty-Four* (1949), George Orwell said: "there was of

course no way of knowing whether you were being watched at any given moment ... you had to live ... in the assumption that every sound you made was overheard, and, except in darkness, every movement scrutinised". In Radford's film the telescreens were bidirectional and in a world with an ever increasing number of telescreen devices the citizens of Oceania were spied on more than they thought possible. In *The Electronic Eye: The Rise of Surveillance Society* (1994) the sociologist David Lyon concluded that "no single metaphor or model is adequate to the task of summing up what is central to contemporary surveillance, but important clues are available in Nineteen Eighty-Four and in Bentham's panopticon".

The French philosopher Gilles Deleuze shaped the emerging field of surveillance studies with the 1990 essay *Postscript on the Societies of Control*.²¹ Deleuze argued that the society of control is replacing the discipline society. With regards to the panopticon, Deleuze argued that "enclosures are moulds ... but controls are a modulation". Deleuze observed that technology had allowed physical enclosures, such as schools, factories, prisons and office buildings, to be replaced by a self-governing machine, which extends surveillance in a quest to manage production and consumption. Information circulates in the control society, just like products in the modern economy, and meaningful objects of surveillance are sought out as forward-looking profiles and simulated pictures of future demands, needs and risks are drawn up.²⁷

In 1997, Thomas Mathiesen in turn expanded on Foucault's use of the panopticon metaphor when analysing the effects of mass media on society. He argued that mass media such as broadcast television gave many people the ability to view the few from their own homes and gaze upon the lives of reporters and celebrities. Mass media has thus turned the discipline society into a viewer society. In the 1998 satirical science fiction film *The Truman Show*, the protagonist eventually escapes the OmniCam Ecosphere, the reality television show that, unknown to him, broadcasts his life around the clock and across the globe. But in 2002, Peter Weibel noted that the entertainment industry does not consider the panopticon as a threat or punishment, but as "amusement, liberation and pleasure". With reference to the Big Brother television shows of Endemol Entertainment, in which a group of people live in a container studio apartment and allow themselves to be recorded constantly, Weibel argued that the panopticon provides the masses with "the pleasure of power, the pleasure of sadism, voyeurism, exhibitionism, scopophilia, and narcissism". In 2006, Shoreditch TV became available to residents of the Shoreditch in London, so that they could tune in to watch CCTV footage live. The service allowed residents "to see what's happening, check out the traffic and keep an eye out for crime".

In their 2004 book *Welcome to the Machine: Science, Surveillance, and the Culture of Control*, Derrick Jensen and George Draffan called Bentham "one of the pioneers of modern surveillance" and argued that his panopticon prison design serves as the model for modern supermaximum security prisons, such as Pelican Bay State Prison in California. In the 2015 book *Dark Matters: On the Surveillance of Blackness*, Simone Browne noted that Bentham travelled on a ship carrying slaves as cargo while drafting his panopticon proposal. She argues that the structure of chattel slavery haunts the theory of the panopticon. She proposes that the 1789 plan of the slave ship *Brookes* should be regarded as the paradigmatic blueprint. Drawing on Didier Bigo's *Banopticon*, Brown argues that society is ruled by exceptionalism of power, where the state of emergency becomes permanent and certain groups are excluded on the basis of their future potential behaviour as determined through profiling.

The metaphor of the panopticon prison has been employed to analyse the social significance of surveillance by closed-circuit television (CCTV) cameras in public spaces. In 1990, Mike Davis reviewed the

design and operation of a shopping mall, with its centralised control room, CCTV cameras and security guards, and came to the conclusion that it “plagiarizes brazenly from Jeremy Bentham’s renowned nineteenth-century design”. In their 1996 study of CCTV camera installations in British cities, Nicholas Fyfe and Jon Bannister called central and local government policies that facilitated the rapid spread of CCTV surveillance a dispersal of an “electronic panopticon”. Particular attention has been drawn to the similarities of CCTV with Bentham’s prison design because CCTV technology enabled, in effect, a central observation tower, staffed by an unseen observer.:249

Employment and management Shoshana Zuboff used the metaphor of the panopticon in her 1988 book *In the Age of the Smart Machine: The Future of Work and Power* to describe how computer technology makes work more visible. Zuboff examined how computer systems were used for employee monitoring to track the behavior and output of workers. She used the term ‘panopticon’ because the workers could not tell that they were being spied on, while the manager was able to check their work continuously. Zuboff argued that there is a collective responsibility formed by the hierarchy in the information panopticon that eliminates subjective opinions and judgements of managers on their employees. Because each employee’s contribution to the production process is translated into objective data, it becomes more important for managers to be able to analyze the work rather than analyze the people.

Foucault’s use of the panopticon metaphor shaped the debate on workplace surveillance in the 1970s. In 1981 the sociologist Anthony Giddens expressed scepticism about the ongoing surveillance debate, criticising that “Foucault’s ‘archaeology’, in which human beings do not make their own history but are swept along by it, does not adequately acknowledge that those subject to the power ... are knowledgeable agents, who resist, blunt or actively alter the conditions of life.”:39 The social alienation of workers and management in the industrialised production process had long been studied and theorised. In the 1950s and 1960s, the emerging behavioural science approach led to skills testing and recruitment processes that sought out employees that would be organisationally committed. Fordism, Taylorism and bureaucratic management of factories was still assumed to reflect a mature industrial society. The Hawthorne Plant experiments (1924–1933) and a significant number of subsequent empirical studies led to the reinterpretation of alienation: instead of being a given power relationship between the worker and management, it came to be seen as hindering progress and modernity. The increasing employment in the service industries has also been re-evaluated. In *Entrapped by the electronic panopticon? Worker resistance in the call centre* (2000), Phil Taylor and Peter Bain argue that the large number of people employed in call centres undertake predictable and monotonous work that is badly paid and offers few prospects. As such, they argue, it is comparable to factory work.:15

The panopticon has become a symbol of the extreme measures that some companies take in the name of efficiency as well as to guard against employee theft. Time-theft by workers has become accepted as an output restriction and theft has been associated by management with all behaviour that include avoidance of work. In the past decades “unproductive behaviour” has been cited as rationale for introducing a range of surveillance techniques and the vilification of employees who resist them.:x In a 2009 paper by Max Haiven and Scott Stoneman entitled *Wal-Mart: The Panopticon of Time* and the 2014 book by Simon Head *Mindless: Why Smarter Machines Are Making Dumber Humans*, which describes conditions at an Amazon depot in Augsburg, it is argued that catering at all times to the desires of the customer

can lead to increasingly oppressive corporate environments and quotas in which many warehouse workers can no longer keep up with demands of management.

Social media The concept of panopticon has been referenced in early discussions about the impact of social media. The notion of dataveillance was coined by Roger Clarke in 1987, since then academic researchers have used expressions such as superpanopticon (Mark Poster 1990), panoptic sort (Oscar H. Gandy Jr. 1993) and electronic panopticon (David Lyon 1994) to describe social media. Because the controlled is at the center and surrounded by those who watch, early surveillance studies treat social media as a reverse panopticon.

In modern academic literature on social media, terms like lateral surveillance, social searching, and social surveillance are employed to critically evaluate the effects of social media. However, the sociologist Christian Fuchs treats social media like a classical panopticon. He argues that the focus should not be on the relationship between the users of a medium, but the relationship between the users and the medium. Therefore, he argues that the relationship between the large number of users and the sociotechnical Web 2.0 platform, like Facebook, amounts to a panopticon. Fuchs draws attention to the fact that use of such platforms requires identification, classification and assessment of users by the platforms and therefore, he argues, the definition of privacy must be reassessed to incorporate stronger consumer protection and protection of citizens from corporate surveillance.

According to professor Donald Preziosi, the panopticon prison of Bentham resonates with the memory theatre of Giulio Camillo, where the sitting observer is at the centre and the phenomena are categorised in an array, which makes comparison, distinction, contrast and variation legible. Among the architectural references Bentham quoted for his panopticon prison was Ranelagh Gardens, a London pleasure garden with a dome built around 1742. At the center of the rotunda beneath the dome was an elevated platform from which a 360 degrees panorama could be viewed, illuminated through skylights. Professor Nicholas Mirzoeff compares the panopticon with the 19th-century diorama, because the architecture is arranged so that the seer views cells or galleries.

In 1854 the work on the building that was to house the Royal Panopticon of Science and Art in London was completed. The rotunda at the centre of the building was encircled with a 91 meter procession. The interior reflected the taste for religiously meaningless ornament and emerged out of the contemporary taste for recreational learning. Visitors of the Royal Panopticon of Science and Art could view changing exhibits, including vacuum flasks, a pin making machine and a cook stove. However, a competitive entertainment industry emerged in London and despite the varying music, the large fountains, interesting experiments and opportunities for shopping, two years after opening the amateur science panopticon project closed.

Panopticon principle lies as the central idea in the plot of *We* (Russian: *Мы*, romanized: *My*), a dystopian novel by Russian writer Yevgeny Zamyatin, written 1920–1921. Zamyatin goes beyond a concept of a single prison and projects panopticon principles to the whole society where people live in buildings with fully transparent walls.

Foucault's theories positioned Bentham's panopticon prison in the social structures of 1970s Europe. This led to the widespread use of the panopticon in literature, comic books, computer games, and TV series. In *Doctor Who*, an abandoned panopticon was featured. In the 1981 the novella *Chronicle of a Death Foretold* by Gabriel García Márquez on the murder of Santiago Nasar, chapter four is written

with a view on the characters through the panopticon of Riohacha. Angela Carter, in her 1984 novel *Nights at the Circus*, linked the panopticon of Countess P to a “perverse honeycomb” and made the character the matriarchal queen bee. In the 2011 TV series, *Person of Interest*, Foucault’s panopticon is used to grasp the pressure under which the character Harold Finch suffers in the post-9/11 United States of America. In the manga series *Usogui* by author Sako Toshio, an abandoned panopticon is the main setting of the Air Poker arc.

Annotation/description:

The territoriality of the cloud is not always hidden away in devices, pipes, or server farms. Sometimes the cloud’s centralizing logic finds expression within architecture, urban design, and the brick and

mortar of physical spaces. The “smart” brand of urbanism is one built up of equal parts neoliberal spatial strategies and techno-utopian ideologies, which attempt to bridge the gap left by weakening government oversight and the deteriorating agency of public urban planning institutions in cities worldwide. Cash-strapped cities wanting to compete with other global cities for jobs and development dollars give away billions in incentives just for the chance of having a tech giant land in their town. For the most part, the urban projects of the cloud—the “smart” cities, towns, neighborhoods instigated by tech companies that treat data as a resource to be extracted—take the form of enclaves, campuses, or neighborhoods that are contextually closed-off, controllable, and technologically decked-out. In a lot of ways, these projects are the culmination of all the other layers of Farms, Pipes, and Mines. The concentration of resources and infrastructures, selective regulatory suspension and lucrative incentive packages, and the uninterrupted access to user data as well as control of key infrastructures, all coalesce into detached enclaves that operate in a vacuum that is deemed necessary for “innovation” and technological “experimentation.” The idea of the campus, as an urban morphology, is invoked here both as the internalization of control over seemingly finite and defined conditions, as well as a defensive mechanism against external forces, which are manifested as either governmental/regulatory, social, or environmental. In advancing their neoliberal agendas the urban projects of the cloud seamlessly combine utopian imaginaries, frontier ideologies, and extrastatecraft strategies to generate enclaves of privilege, which are separated from the larger urban realm. In doing so, each aspect carries with it the escapist and the separationist ideals coded into the campus morphology.

The use of small datasets raises awareness of the ethical, environmental and bias challenges inherent in large datasets. This focus goes beyond the creative sphere: it includes ethical and sustainable data practices, and aligns the project with broader principles of responsible technological engagement. Can small data sets collected, curated and analyzed by artists offer an alternative to the statistical repetition of artificial intelligence algorithms? What creative possibilities arise from the use of these data? What are the tensions and resistances between algorithms and artistic practices working with small data sets? Can the use of them provide a more energy-efficient alternative to models trained on large amounts of information?

Annotation/description:

The Gathering Cloud is a hybrid print- and web-based work by J. R. Carpenter which aims to address the environmental impact of so-called 'cloud' computing through the oblique strategy of calling attention to the materiality of the clouds in the sky. Both are commonly perceived to be infinite resources, at once vast and immaterial; both, decidedly, are not.

Then Rebecca Solnit confirmed it herself on my FB page: she knows she's doing theology. The question is whether her secular progressive audience recognizes it too. The interview about hope, collective action, and the future of the left, is packed with Buddhist, liberation theology, and Indigenous frameworks. Hiding in plain sight. Swipe to see what I mean. Comment SANGHA for a link to the full piece."

Annotation/description:

This paper examines how design research can unmake AI's classificatory ontologies through situated and embodied annotation practices. Drawing on feminist, queer, and critical data epistemologies, it reframes bias not as a technical flaw but as a generative condition that reveals how knowledge is produced and negotiated within human-AI assemblages. An autotheoretical experiment grounds the inquiry. The researcher creates and annotates a dataset of self-representations using subjective, affective, and relational labels, training a small-scale model to probe classification as an interpretive encounter shaped by embodiment, ambiguity, and positionality. Building on the shift from debiasing toward reflexive data practices in design and HCI, the paper proposes situated annotation as a design inquiry for unsettling inherited AI ontologies and repositioning machine vision as an accountable, partial, and embodied way of knowing.

Annotation/description:

This paper presents Small AI as a conceptual lever for designers to resist the 'bigger is better' trend in the discourse and development of Generative AI. We explore different types of Small AI: initially in relation to the size of models, as smaller models require less computational resources for both training and inference, thus implying a smaller ecological footprint. However, we extend the meaning of smallness to apply to political, epistemic and cultural domains as well. In this vein, the paper posits Small AI as an imaginary-in-the-making, and a rallying concept for an alternative innovation agenda that holds, in the spirit of E.F. Schumacher's famous dictum, that it is small (AI) and not big (AI) that is beautiful. The paper draws conclusions for those designing with/for AI, positing Small AI as a form of 'unmaking' with which designers may re-articulate the entangled relations between users, computation, and worlds.
